

Hi, I'm Arun Kumar 24 years old And I belong to Chennai, I have completed B.E Civil engineering at S.A Engineering college, I have a year of work experience in Highway department as a Technical assistant, Talking about my interests, I like to play badminton, I do cycling every day to keep me fit and healthy. I'd love to hear music and to play games as well. Now why I joined this course, because I need a switch in my job career path. As I mentioned working in the Highway department, it's a challenging job. Need to travel a lot, the working environment is not good as expected but One good thing is you can gain some knowledge in construction works. I have worked in construction execution side but not in designs, by thinking about my future in this field for 5 years is miserable and my intuition said "you can't travel in this field for a long time", Then I got confused and planning to switch my job as soon as possible. Now here comes the challenging part, what is my next job role? And how to choose it wisely. I like to work with computers then I came up with an idea 'why not IT field' then I started to do common research in the IT field and finally came up with data science, I like to do research things so, I choose data science, I asked myself is it worth studying data science? Because changing from one field to another is difficult, and I know nothing about python programming as well, then I decided to give it a try, after few sessions of learning python, it completely changed my way of thinking. And I'm looking forward to learning more in this data scientist program at Edyoda.
